

Setting Up License Manager from Scratch

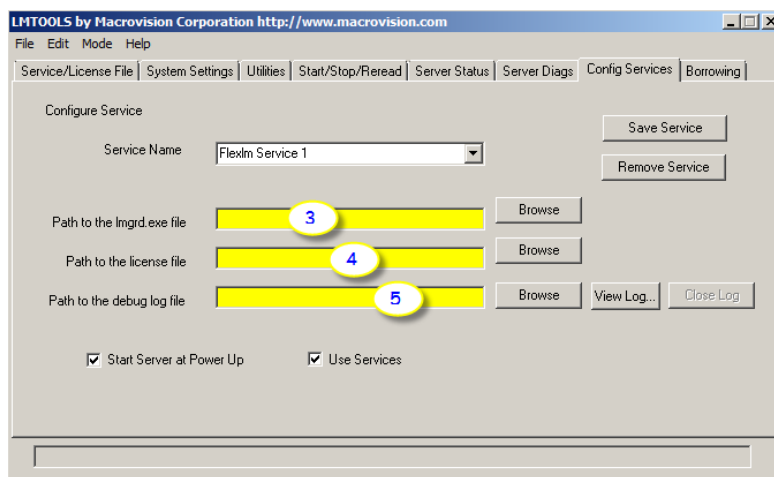

After installing the License Manager, open up the LMTools and go to the System Settings tab. Make note of the Computer name and Ethernet Address

- 1- Computer/Hostname: _____
- 2- Ethernet Address: _____

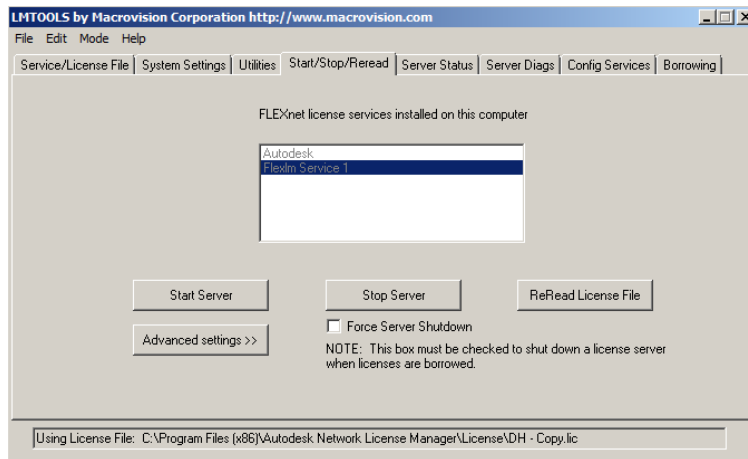

Call Autodesk's Product Registration 1-800-551-1490 to get your license file. They will need the above info and your serial number(s).

Save that file in C:\Program Files\Autodesk Network License Manager\License
Once that information is obtained, go to the Config Services tab:

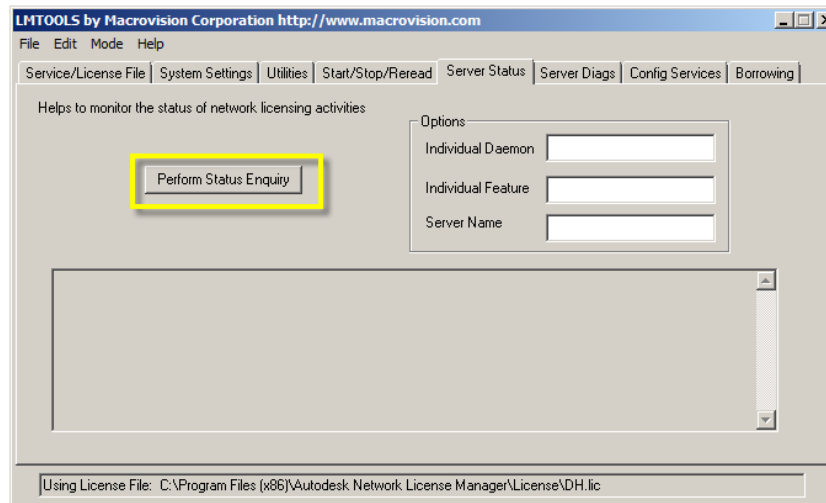

- 3- Browse to <C:\Program Files\Autodesk Network License Manager\lmgrd.exe>
- 4- Browse to the license file you obtained saved in <C:\Program Files\Autodesk Network License Manager\License> from above
- 5- Open up Notepad and save a blank file as debug.log (make sure the extension is .log) and save it in <C:\Program Files\Autodesk Network License Manager\License> then select that for this location. Once that is filed out, check the [Use Services](#) and [Start Server at Power Up](#). Then Click on [Save Service](#).

Next go to the **Start/Stop/Reread** tab:

Click on [Start Server](#) and then [ReRead License](#). At the bottom of the screen it should let you know what is going on. It should state Server start successful and ReRead License successful after hitting each.

Next go to the **Server Status** tab:

Click on the [Perform Status Enquiry](#) button. In the text below it should read in there that license server is UP and will list the available licenses. If that is listed there, the license manager part of it is up and running.
